Manage employee expenses using expense reports

> **Important**
>
> **Some of the functionality described in this release plan has not been released.** Delivery timelines may change and projected functionality may not be released (see Microsoft policy). Learn more: What's new and planned

Expand table

Enabled for	Public preview	General availability
Users, automatically	May 2026	Oct 2026

Business value

Expense management is a critical process for most organizations, yet many Business Central customers have relied on external solutions to handle it. With native expense reports, you can capture, approve, and reimburse employee expenses directly within Business Central. This reduces complexity, improves data accuracy, and ensures a seamless experience across finance and operations without additional integrations or costs.

Feature details

The new **Expense Management** module introduces **Expense Reports** as a built-in Business Central capability. Employees can create expense categories, expense reports, add multiple expense lines into expense reports, itemize costs, calculate per diem, and record mileage. Managers can review, update, and approve or reject reports, while accountants can post reimbursements and configure posting accounts for different expense types.

The following are some key highlights:

- **Expense Capture**: Enter expenses manually into **Expense Reports**, itemize, add participants, and calculate per diem. Post your expense reports when they're ready and get **Posted Expense Reports** and **Expense Ledger Entries** for reports and analyses.
- **Approval Workflow**: Managers can review, edit, and approve or reject reports. Employees can track approval status.

- **Reimbursement Posting**: Post reimbursements to create employee ledger entries and expense ledger entries with automated document numbering and configurable accounts using **Expense Categories** and **Expense Posting Groups**.

This feature closes a long-standing gap by enabling you to use standard Business Central features to manage expenses.

Use self-billed invoices

> **Important**
>
> **Some of the functionality described in this release plan has not been released.** Delivery timelines may change and projected functionality may not be released (see Microsoft policy). Learn more: What's new and planned

Expand table

Enabled for	Public preview	General availability
Users, automatically	Apr 2026	Jun 2026

Business value

Self-billing reduces operational friction by allowing buyers to generate invoices on behalf of suppliers under a mutual agreement. This improves accuracy, accelerates processing, and eliminates delays caused by missing or inconsistent supplier-issued invoices. With automated layouts, posting rules, and vendor configuration, you can streamline both compliance and internal controls while ensuring clean financial records.

Feature details

Business Central offers full support for self-billed invoices in the purchase process. Buyers can now generate invoices on behalf of a vendor when a self-billing agreement is in place. A new Boolean field on the **Vendor Card** page enables this agreement, and all **Purchase Invoices** created for that vendor, whether from **Purchase Orders** or directly, are automatically marked as self-billed. Vendors can also be assigned a dedicated **No. Series** for self-billed invoices, ensuring correct document sequencing.

A new report layout, **Posted Purchase Invoice – Self-Billing Invoice**, formats the invoice to align with the sales invoice style, showing buyer company information, vendor details, VAT information, and all essential invoice data.

For Danish localizations, the posting process can automatically create **Digital Vouchers** when you enable self-billing, ensuring compliance with local audit and documentation rules. To prevent conflicts between buyer-issued and supplier-issued documents, vendors with a self-billing agreement can't receive inbound e-documents for accounts payable. This

guarantees data integrity and avoids duplicate or contradictory documents in the purchase flow.

Governance and administration

> **Important**
>
> **Some of the functionality described in this release plan has not been released.** Delivery timelines may change and projected functionality may not be released (see Microsoft policy). Learn more: What's new and planned

Business Central gives administrators more tools for managing environments, apps, and data migrations. With these tools, administrators can solve customer needs and handle a variety of administrative scenarios.

New features in Business Central improve security, flexibility, and partner management for customers with multiple environments. Administrators can assign partner access to specific environments, which simplifies control and compliance. Customer-managed encryption keys enhance data protection and help businesses meet privacy standards. Extended update windows give administrators more flexibility to schedule upgrades. A unified interface for managing per-tenant extensions (PTEs) and AppSource apps streamlines deployment across environments and saves time. IPv6 supports connectivity, ensures seamless service, and enhances data security.

Audit user and group permissions across apps

> **Important**
>
> **Some of the functionality described in this release plan has not been released.** Delivery timelines may change and projected functionality may not be released (see Microsoft policy). Learn more: What's new and planned

Expand table

Enabled for	Public preview	General availability
Users, automatically	-	Apr 2026

Business value

As an admin, this new capability empowers you to clearly understand how permissions flow through your environment, reducing security blind spots and improving compliance. By viewing expanded permissions across all apps and extensions in one place, you can quickly identify which permission sets grant access to specific objects or actions, such as who can edit a customer record. The ability to filter by object, scope, extension, or permission set enables faster, more accurate analysis during audits or troubleshooting. With integrated FactBoxes showing related security groups and users, your organization gains immediate visibility into who is affected by each permission set, strengthening overall security governance.

Feature details

The new **Permissions Overview** page provides comprehensive visibility into permission sets across all installed apps and extensions.

Key capabilities:

- View permissions from all apps and extensions in a unified view.
- Filter data by object, scope, extension, or permission set to quickly find specific permissions.
- Identify which permission sets grant access to a specific object (for example, which sets allow editing customer records).

- Use FactBoxes that show which security groups and users are assigned each permission set.

This centralized view helps administrators analyze permission dependencies, conduct security audits, and troubleshoot access issues without navigating multiple pages or extensions.

Comply with local data residency requirements in Italy

> **Important**
>
> **Some of the functionality described in this release plan has not been released.** Delivery timelines may change and projected functionality may not be released (see Microsoft policy). Learn more: What's new and planned

Expand table

Enabled for	Public preview	General availability
Admins, makers, marketers, or analysts, automatically	-	Jun 2026

Business value

Moving your Italian environments to the Italy Azure Geo ensures that your Business Central environments comply with local data residency requirements in Italy and can improve latency for users in the region.

Feature details

Starting in 2025 release wave 2, Business Central environments configured with the Italian localization are hosted in the Italy Azure Geo instead of the Europe Azure Geo. This change provides the following benefits:

- **Data residency compliance**: Aligns with Italian regulatory requirements for cloud services.
- **Improved performance**: Reduced latency for customers operating in Italy.
- **Seamless migration**: No manual steps required for most environments; Microsoft handles the transition.
- **No impact on functionality**: All existing features and integrations remain unchanged.

Customers don't need to take any action, unless they link their Business Central environment to a Power Platform environment. The migration occurs automatically during scheduled environment updates, and notifications are sent in advance.

Connect AI agents to the admin center through MCP server

> **Important**
>
> **Some of the functionality described in this release plan has not been released.** Delivery timelines may change and projected functionality may not be released (see Microsoft policy). Learn more: What's new and planned

Expand table

Enabled for	Public preview	General availability
Admins, makers, marketers, or analysts, automatically	Apr 2026	-

Business value

Managing Business Central environments often requires scripting or building integrations for routine administrative tasks. The Business Central admin center MCP server enables administrators and partners to interact with environment management APIs conversationally through AI tools such as Visual Studio Code.

Feature details

The 2026 release wave 1 starts the preview of the Model Context Protocol (MCP) server that exposes Business Central admin center APIs in a standardized, self-describing way. MCP-compatible AI agents can discover available admin operations, understand context, and perform environment management tasks.

Using tools like Visual Studio Code, administrators can ask questions such as environment update status, available upgrades, or installed extensions, and receive structured responses sourced directly from the admin center. Agents can also propose follow-up actions, such as copying an environment to a sandbox, scheduling an update, or investigating a failed upgrade, while keeping the user in control through explicit confirmation steps.

Example scenarios include:

- Checking whether updates are available for environments and when they're scheduled.
- Copying an environment to a sandbox and triggering an immediate update.
- Reviewing update history and diagnosing failed upgrades.

- Listing installed extensions for a given environment.

This approach simplifies common admin workflows that previously required PowerShell scripts or Logic Apps, making environment management more accessible and consistent across tools while reusing the same secure Business Central admin center APIs.

Migrate to the cloud from any SQL database

> **Important**
>
> **Some of the functionality described in this release plan has not been released.** Delivery timelines may change and projected functionality may not be released (see Microsoft policy). Learn more: What's new and planned

Expand table

Enabled for	Public preview	General availability
Admins, makers, marketers, or analysts, automatically	Mar 2026	Apr 2026

Business value

Deliver faster, repeatable, and reliable migrations from SQL-based systems to Business Central using the same proven tooling as with Business Central, Dynamics GP, and Dynamics SL migrations. You save time and money by building migration solutions once and deploying them across multiple customers, eliminating custom scripts, reducing risks, and ensuring a consistent admin experience.

Feature details

Business Central cloud migration tooling is extended to let developers build fast, repeatable, and reliable data migration engines for SQL-based source systems. These custom migration engines are implemented as extensions and can be packaged, installed, and reused through AppSource, enabling consistent delivery across customer projects.

The platform introduces a generic, system-level migration module that integrates directly with the Cloud Migration wizard through a new Generic Custom migration type. Developers implement a standardized AL interface that defines how data is mapped, replicated, and transformed from external SQL sources into Business Central. The platform provides shared helper methods to simplify custom implementations, including mapping helpers, replication and transformation orchestration, and a generic UI for tracking migration progress and errors.

Custom migration engines built using this model have the same core migration capabilities as Microsoft-provided migration engines for Business Central, Dynamics GP, and Dynamics SL.

Migration execution, status, and failures surface in a generic migration UI, ensuring a consistent administrative experience across built-in and partner-provided migrations.

This extensibility model allows partners and ISVs to create reusable, supported migration solutions for legacy and industry-specific systems, reducing project risk and eliminating the need for ad hoc scripts, external tooling, or one-off migration code.

Run reimplementation projects using cloud migration tool

> **Important**
>
> **Some of the functionality described in this release plan has not been released.** Delivery timelines may change and projected functionality may not be released (see Microsoft policy). Learn more: What's new and planned

Expand table

Enabled for	Public preview	General availability
Admins, makers, marketers, or analysts, automatically	-	May 2026

Business value

Enable faster reimplementations by reusing core business data from existing Business Central solutions instead of starting a new implementation from scratch.

Feature details

In 2026 release wave 1, it's easier to take on Business Central reimplementation projects by migrating data from older Business Central on-premises versions. New cloud migration tooling provides a supported end-to-end reference implementation that migrates essential master and transactional data only, enabling customers to move off legacy versions without carrying forward obsolete customizations.

The initial scope covers company migration scenarios from Business Central version 14, including core master data (customers, vendors, items), selected transactional data, opening balances, and required setup tables. The reference implementation demonstrates end-to-end replication, data transformation, and upgrade logic aligned with Dynamics 365 Business Central data semantics.

The tooling is designed to be extensible by developers, allowing partners to contribute additional migration modules where needed and adapt the reference implementation to specific customer scenarios. This provides a stable, extensible foundation for reimplementation projects, with more functionality planned for future releases based on partner and customer feedback.

Reporting and data analysis

> **Important**
>
> **Some of the functionality described in this release plan has not been released.** Delivery timelines may change and projected functionality may not be released (see Microsoft policy). Learn more: What's new and planned

In today's world, data is an invaluable resource. It forms the foundation of decision-making and progress across all sectors. Recent advances in AI technology and data analytics tools bring radically new ways for businesses to turn complex information into actionable intelligence. These advances reveal hidden patterns and trends, and they find correlations that earlier methods missed. The critical insights that data analysis provides empower organizations to optimize their strategies, enhance customer experiences, and identify potential risks. With these insights, organizations gain unprecedented understanding of their operations and environments. They can innovate in ways that once seemed impossible.

As data continues to fuel innovation and drive transformative advancements, harnessing its potential is essential for staying competitive. For small and medium-sized businesses, data helps shape a more efficient and sustainable future.

Our reporting strategy focuses on building universal BI and analytics within the Business Central experience. We aim to seamlessly integrate in-context, rich, and immersive BI and analytics content from first and third parties into Business Central. With flexible self-service capabilities, you can easily access and use your data for maximum value.

Community-authored content. This article is written and maintained by experts in our Microsoft Learn community.

Business value

Report layout administrators gain full control over the lifecycle of report layouts by assigning statuses such as Draft, Pending Approval, Approved, or Retired. These statuses ensure that only approved layouts are available to users, reducing errors and improving compliance with internal standards. By managing layouts through clear stages, businesses can streamline governance, accelerate approvals, and maintain consistency across reporting. Ultimately, this feature enhances operational efficiency and supports better decision-making through reliable, well-managed layouts.

Feature details

Report layout administrators can set the status of report layouts to control their lifecycle stages. The following statuses are available:

- **Draft**: Layout is under development and not available to users.
- **Pending approval**: Layout is awaiting approval.
- **Approved**: Layout is approved and available to users.
- **Retired**: Layout is phased out and no longer available.

Showcase analytics with enhanced demo data

> **Important**
>
> **Some of the functionality described in this release plan has not been released.** Delivery timelines may change and projected functionality may not be released (see Microsoft policy). Learn more: What's new and planned

Expand table

Enabled for	Public preview	General availability
Users, automatically	-	Apr 2026

Business value

We're giving our partners richer demo data across the Sales, Purchasing, and Fixed Assets modules to enable you to showcase realistic business scenarios without manual setup. The data can help you demonstrate advanced reporting and analytics capabilities, making it easier for stakeholders to experience how Business Central drives informed decisions. By reducing preparation time and making demos more relevant, you accelerate adoption and highlight the solution's value for finance and operations teams.

Feature details

We're enhancing the demo data for the Sales, Purchasing, and Fixed Assets modules to make it easier to demonstrate the reporting and analytics in those areas. The following lists briefly describe the enhancements in each area.

Sales

- Salespersons: Distributed sales documents across more salespeople.
- Open orders: Added more open sales orders.
- Backorders: Added more sales backorders.
- Due dates: Spread out the due date of existing sales documents.
- Deferral codes: Added deferral codes to posted and unposted sales documents.
- Discounts: Added line discounts to posted sales invoices.

Purchasing

- Added new purchasing department dimension and used that on purchase documents before posting.
- Purchasing Module: Added purchasers and return reasons to existing purchase documents.
- Analytics Module: Added purchasers and return reasons to existing purchase documents.

Fixed Assets

- Added dimension setup and posted entries for fixed assets.

Enhanced Subscription Billing Power BI app

> **Important**
>
> **Some of the functionality described in this release plan has not been released.** Delivery timelines may change and projected functionality may not be released (see Microsoft policy). Learn more: What's new and planned

Expand table

Enabled for	Public preview	General availability
Users, automatically	-	Apr 2026

Business value

This update enhances the Subscription Billing Power BI app by delivering a more consistent, modern experience across all reports. You get improved layouts, richer visuals such as KPI cards, maps, and conditional formatting, and added navigation for easier drill-down analysis. These changes make insights clearer, forecasts more accurate, and decision-making faster, helping you optimize subscription revenue and manage churn effectively.

Feature details

We've updated the Subscription Billing Power BI app with new features and generally aligned its appearance with the style of the other Power BI apps. We also introduced map visuals for data with locations, enhanced analyses on profitability, and introduced drill-back from the report back to the transactions in Business Central.

The following reports are updated:

- Subscription Billing Overview
- Revenue Year-Over-Year
- Revenue Analysis
- Revenue Development
- Churn Analysis
- Revenue by Item
- Revenue by Customer
- Revenue by Salesperson
- Total Contract Value Year Over Year Growth

- Total Contract Value Analysis
- Customer Deferrals
- Vendor Deferrals
- Revenue Forecast
- Billing Forecast

Here are more details about the changes we made to each report:

Subscription Billing Overview

- Updated the Layout of Overview page to align with other embedded reports in Business Central and focus high-level analysis across the Customers, Vendors, and Package dimensions.
- Updated the Top 5 Customer and Vendor visuals to be stacked bar charts for easier analysis of key revenue and cost sources.
- Implemented KPI Card pages to emphasize key Subscription Billing measures.

Revenue Year-Over-Year

- Added **Mon. Recurring Revenue by Package** for more dynamic analysis by subscription packages.
- Added a **Tooltips to Recurring Revenue by Month** visual to improve access to supporting measures.
- Applied conditional formatting to emphasize key measures and updated time intelligence visual to a line chart to align with other reports.

Revenue Analysis

- Added **Item Category** and **Salesperson** navigation visuals to the left of the decomposition tree for easier analysis and to align with the sales and purchasing reports.

Revenue Development

- Updated the time intelligence visual to focus on total change and align with other embedded reports in Business Central.
- Moved additional measures to tooltips to improve clarity when analyzing the **Change to Monthly Revenue** report.
- Added support for a fiscal calendar hierarchy to enhance flexibility when analyzing by date.

Churn Analysis

- Added **Churn by Fiscal Period and Customer** visuals to the left of the decomposition tree for easier analysis and to align with sales and purchasing reports.

Revenue by Item

- Added a **Profitability by Item Category** scatter chart for more engaging visualization of item profit and revenue performance.
- Added support for an item category hierarchy to enhance flexibility when analyzing by item categories.
- Updated the **Mon. Recurring Revenue by Item** visual to be a tree map for consistency with other embedded reports.
- Added conditional formatting to emphasize the **Monthly Profit %** measure.

Revenue by Customer

- Added Customer Location Map visual to improve subscription profit insights across customer demographics.
- Added conditional formatting to emphasize key Monthly Net Profit % measure

Revenue by Salesperson

- Added a **Profitability by Salesperson** visual for more engaging visualization of salesperson profit and revenue performance.
- Added conditional formatting to emphasize key **Net Profit %** measures.
- Implemented consistent legend formatting for easier analysis by salesperson.

Total Contract Value Year Over Year Growth

- Updated the **Total Contract Value by Calendar Year** visual to align with other embedded reports in Business Central.
- Added a **Total Contract Change** measure to tooltip to allow for easier analysis when comparing against previous year.
- Added conditional formatting to matrix visual to emphasize the **Total Contract Value** measure.

Total Contract Value Analysis

- Added **Contract Value by Package and Salesperson** visuals to the left of the decomposition tree for easier analysis and to align with sales and purchasing reports.

Customer Deferrals

- Added a **Customer Deferrals by Released Status** pie chart visual for easier analysis of total customer deferrals by status.

Vendor Deferrals

- Added a **Vendor Deferrals by Released Status** pie chart visual for easier analysis of total customer deferrals by status.

Revenue Forecast

- Added conditional formatting to more effectively analyze revenue forecast trends and outliers, and align with the sales app.

Billing Forecast

- Added a dedicated **Billing Forecast by Vendor** table to improve clarity when analyzing vendor and customer forecasts.
- Added conditional formatting to more effectively analyze billing forecast trends and outliers.

Financial Reporting enhancements

> **Important**
>
> **Some of the functionality described in this release plan has not been released.** Delivery timelines may change and projected functionality may not be released (see Microsoft policy). Learn more: What's new and planned

Expand table

Enabled for	Public preview	General availability
Users, automatically	-	Apr 2026

Business value

The enhancements to the Financial Reporting feature help businesses streamline financial reporting by reducing manual effort and improving consistency. Report authors gain flexibility to customize layouts and branding, while users can automate distribution and consolidate multiple reports into a single PDF for easier sharing. Administrators benefit from centralized control of global defaults and enhanced audit capabilities, ensuring compliance and transparency. Together, these improvements save time, reduce errors, and deliver professional, tailored outputs that strengthen decision-making and governance.

Feature details

Report users, authors, and administrators get new features to make common tasks in financial reporting more efficient.

Report authors can:

- Choose to display the company logo on PDF outputs.
- Override global defaults for negative number format, report period, and logo placement on single reports.

Report users can:

- Schedule reports for a distribution group. Recipients can get the report output in an email and in their report inbox.
- Run a report over all values of a dimension.
- Run multiple reports and get a single PDF with the result.

Report administrators can:

- Set global defaults for negative number format, report period, and logo placement.
- Monitor report use from a new audit log.

Modernizing analytical reports for inventory

> **Important**
>
> **Some of the functionality described in this release plan has not been released.** Delivery timelines may change and projected functionality may not be released (see Microsoft policy). Learn more: What's new and planned

Expand table

Enabled for	Public preview	General availability
Users, automatically	-	Apr 2026

Business value

Modernized inventory reports deliver a more intuitive experience by replacing outdated RDL layouts with familiar Excel and Word formats, making analysis and editing easier. Updated documentation helps you quickly learn about and apply these reports. The addition of the new Item Age Composition by Quantity and Value report provides deeper insights into ageing inventory. Deprecating older reports reduces redundancy and streamlines reporting for better decision-making and operational efficiency.

Feature details

We've added modernized versions of the following inventory reports:

- Inventory Top 10 List
- Item Availability
- Inventory Purchase Orders
- Item/Vendor Catalog
- Inventory Availability Plan
- Item Age Composition by Quantity and Value (new report)
- Inventory - Transaction Detail
- Item Expiration - Quantity

By *modernizing* a report, we mean:

- We replaced RDL layouts with Excel and Word layouts.

- We updated our documentation in Microsoft Learn.

We're also deprecating the following reports:

- Item Age Composition - Value
- Item Age Composition - Quantity
- Items with Negative Inventory

Set default language for documents on the company level

> **Important**
>
> **Some of the functionality described in this release plan has not been released.** Delivery timelines may change and projected functionality may not be released (see Microsoft policy). Learn more: What's new and planned

Expand table

Enabled for	Public preview	General availability
Users, automatically	-	Apr 2026

Business value

This feature helps ensure that every invoice and sales document your customers receive is clear, professional, and easy to understand by letting you define a companywide default language for all customer-facing documents. By decoupling document language from the individual user's UI language, it eliminates the risk of accidentally sending invoices in the wrong language, an issue that commonly arises in multilingual teams serving primarily local markets. As a result, local customers consistently receive documents in the expected language, improving clarity, reducing follow-up questions or misunderstandings, and strengthening trust in your business. At the same time, the new Default Language Code setting gives you better control without sacrificing flexibility, supporting international scenarios where different language requirements still apply, and ultimately delivering a more reliable and polished customer experience.

Feature details

Previously, the language used on invoices and other sales documents was determined by the language of the user creating or printing the document. This could lead to unintended results in local businesses that primarily serve domestic customers.

For example, even if all customers are local and expect documents in the local language, employees working in a different UI language could inadvertently generate invoices in a foreign language—making them difficult for customers to read.

To address this, we've introduced a new **Default Language Code** field on the **Company Information** page.

You can now define a companywide default language for customer-facing documents. Local customers will consistently receive invoices and other sales documents in the expected language, regardless of the user's UI language. This improves clarity, reduces confusion, and ensures a better customer experience, especially in multilingual teams.

This new setting provides better control over document language while maintaining flexibility for international scenarios.

Use new APIs for analyzing approval workflows for auditors and IT staff

> **Important**
>
> **Some of the functionality described in this release plan has not been released.** Delivery timelines may change and projected functionality may not be released (see Microsoft policy). Learn more: What's new and planned

Expand table

Enabled for	Public preview	General availability
Users, automatically	-	Apr 2026

Business value

This feature enhances transparency and control by enabling secure, read-only access to approval workflows and user actions. Businesses can leverage these APIs to build advanced auditing and compliance reports in tools like Power BI, ensuring stronger governance and accountability. Additionally, integration with Microsoft Copilot Studio and MCP Server opens opportunities for intelligent automation and analytics, driving efficiency and insight. By isolating permissions for API access, organizations maintain robust security while empowering authorized teams to innovate confidently.

Feature details

In this release wave, we're introducing read-only APIs on the (workflow) approval system. This allows for establishing security and auditing analytics and reporting outside Business Central—for example, creating reports with Power BI or agents with Microsoft Copilot Studio and MCP Server for Business Central.

The APIs are read-only and allow querying for:

- Workflow
- Workflow and User mappings
- Workflow, User, and Action history

We're also introducing a new permission set that allows a user to use approval APIs. This shouldn't be granted to standard users, but might be included in security-related permission

sets.

Use new APIs for analyzing permissions for auditors and IT staff

> **Important**
>
> **Some of the functionality described in this release plan has not been released.** Delivery timelines may change and projected functionality may not be released (see Microsoft policy). Learn more: What's new and planned

Expand table

Enabled for	Public preview	General availability
Users, automatically	-	Apr 2026

Business value

The new read-only permission APIs empower businesses to strengthen security and compliance by enabling external auditing and analytics without compromising system integrity. With seamless integration into tools like Power BI and Microsoft Copilot Studio, organizations can create advanced reports and intelligent agents for deeper insights. This capability enhances transparency, supports regulatory requirements, and accelerates decision-making by providing secure, real-time access to permission data. Ultimately, it helps businesses maintain robust governance while unlocking new opportunities for automation and analytics.

Feature details

In this release wave, we're introducing read-only APIs on the permission system. This allows for establishing security and auditing analytics and reporting outside Business Central—for example, creating reports with Power BI or agents with Microsoft Copilot Studio and MCP Server for Business Central.

The APIs are read-only and allow querying for:

- Permission Set
- Object, Scope, Extension info, and Permission Set
- Permission Set and Security Group mappings
- Permission Set and User mappings

We're also introducing a new permission set that allows you to use the new permission APIs. This shouldn't be granted to standard users, but might be included in security-related permission sets.

Supply chain management

> **Important**
>
> **Some of the functionality described in this release plan has not been released.** Delivery timelines may change and projected functionality may not be released (see Microsoft policy). Learn more: What's new and planned

Supply chain management in Business Central offers a range of features, from procurement and production to distribution and logistics. These features help businesses streamline their operations and improve efficiency.

Business Central provides tools for managing the entire supply chain, including inventory management, order processing, and demand forecasting. Businesses can create and manage purchase orders, track inventory levels, and ensure timely delivery of products to customers. Business Central supports various supply chain methodologies, so businesses can choose the approach that best suits their operations.

A key benefit of using Business Central for supply chain management is its integration with other Microsoft products, such as Power BI and Microsoft Teams. These integrations give businesses deeper insights into their supply chain data, help their people collaborate more effectively, and support good decisions based on real-time information.

The investments for the supply chain management area focus on quality management and subcontracting.

Add pictures to item variants to differentiate product options

> **Important**
>
> **Some of the functionality described in this release plan has not been released.** Delivery timelines may change and projected functionality may not be released (see Microsoft policy). Learn more: What's new and planned

Expand table

Enabled for	Public preview	General availability
Users, automatically	-	Apr 2026

Business value

Adding pictures of item variants can reduce confusion when working with large assortments of similar variants. Tiles and tall tiles modes on the list help you quickly identify each variant, which improves accuracy in the variant selection, manufacturing, fulfillment, and sales processes.

Feature details

You can now store pictures for item variants, letting you add images that represent each variant, such as color or size, so you can quickly recognize differences. You can take a picture, import an existing file, export the current image, or delete it from a **Picture** FactBox on the **Item Variant Card** page.

Add a picture to an item variant

1. Open the **Item Card** and choose the **Variants** action.
2. Select the variant that you want to update.
3. On the **Item Variant Card**, in the **Picture** FactBox, choose one of the following actions:
   - **Import** to upload a file.
   - **Take** to use your device camera to capture an image.
   - **Delete** if you don't want the picture.

- **Export** if you want to save the current image.

Business value

Different businesses and users need specific information to complete their processes efficiently. Personalization in Business Central is a powerful tool that lets you tailor the information on your pages by adding fields or columns from a set list. You can now choose from even more fields and columns to add to some pages. This enhancement is driven by community feedback, addressing a common request and giving you greater control over the information displayed. It helps you work more effectively with the data that's most important to your business operations.

Feature details

The **Description 2** field is now available for personalization on more pages.

- **Production BOM Lines** (page 99000788)
- **Production BOM Version Lines** (page 99000789)
- **Prod. BOM Mat. per Ver. Matrix** (page 9287)
- **Prod. BOM Version Comparison** (page 9288)
- **Planning Component List** (page 99000861)
- **Planning Components** (page 99000862)
- **Prod. Order Comp. Lines** (page 5407)
- **Prod. Order Components** (page 99000818)
- **Standard Tasks** (page 99000799)
- **Routing Lines** (page 99000765)

- **Routing Version Lines** (page 99000767)
- **Planning Routing** (page 99000863)
- **Prod. Order Routing** (page 99000817)
- **Prod. Order Routing Lines** (page 5408)
- **Machine Center Task List** (page 99000916)
- **Work Center Task List** (page 99000915)

The **Description 2** field is added at the table level, and is fully supported in planning, routing, production order creation, and related processes.

Approve requisition worksheets and item journals

> **Important**
>
> **Some of the functionality described in this release plan has not been released.** Delivery timelines may change and projected functionality may not be released (see Microsoft policy). Learn more: What's new and planned

Expand table

Enabled for	Public preview	General availability
Users by admins, makers, or analysts	-	Apr 2026

Business value

Gain stronger internal control and improve your audits by requiring approval for item journals and planning or requisition batches before they run. Approval workflows help ensure that purchasing decisions and inventory changes are validated, authorized, and align with business policies.

Feature details

We've extended approval workflows to item journals and requisition and planning worksheets. You can ensure that someone reviews and approves entries before creating purchase documents or posting inventory adjustments.

Approval workflows for item journals

Item Journals now support the same approval workflow capabilities that you have today in general journal batches. You can send batches for approval from the following journals:

- Item Journal
- Physical Inventory Journal
- Output Journal
- Consumption Journal

When a journal batch has an approval entry in progress, you can't edit, delete, or post the record until the approval is completed or canceled. The workflow status shows on the journal pages, and the **Approve**, **Reject**, **Delegate**, and **Comments** approval actions are available.

Approval workflows for requisition and planning worksheets

Requisition and planning worksheets now include full approval workflow support at the worksheet batch level. You can send a worksheet batch for approval before you carry out planning or convert requisition lines into purchase documents. When an approval request is created for a worksheet batch:

- You can't insert, modify, or delete requisition or planning lines.
- The workflow status shows on the worksheet pages.
- Approval actions are available to approve, reject, or delegate the batch.

Worksheet-level approval prevents changes to planning data while decisions are pending.

Enable and use approvals

You configure these approvals under **Workflows**:

1. Choose **Tell me**, enter **Workflows**, and then select the related link.
2. Select an **Item Journal Batch Approval Workflow** or **Requisition Worksheet Batch Approval Workflow** workflow template.
3. Specify the template and batch in the event conditions.
4. Configure approvers and enable the workflow.
5. Open an item journal or requisition/planning worksheet, and choose the **Send for approval** action.
6. Track the status of the approval in the **Status** field on the **Approval Entries** page.

Microsoft Power Automate support is available through updated workflow events and responses, with guidance provided as part of the enhancement.

Create contract service orders with One Service Item Line/Order setting

> **Important**
>
> **Some of the functionality described in this release plan has not been released.** Delivery timelines may change and projected functionality may not be released (see Microsoft policy). Learn more: What's new and planned

Expand table

Enabled for	Public preview	General availability
Users, automatically	-	Apr 2026

Business value

On the Service Management Setup page, the One Service Item Line/Order field enforces a business rule that restricts service orders to contain only one service item line per order. The restriction can help sharpen focus in service workflow because it means you handle and track each service item individually. Now, the same logic applies to orders that you create in bulk from service contracts. You can run the batch process without manual intervention or workarounds, which helps ensure consistency with your service management policies.

Feature details

Based on service contracts, you can automatically create service orders for the maintenance of service items.

1. Select **Search** (Alt+Q), enter **Create Contract Service Orders**, and then choose the related link.
2. Fill in the **Starting Date** and **Ending Date** fields with the starting date and ending date for the period that you want to create contract service orders for. The batch job creates service orders that include service items in service contracts with next planned service dates within this period.
3. Optionally, set more filters that apply to the **Service Contract Header**.
4. Choose **OK**.

Service orders will be created.

The **One Service Item Line/Order** setting on the **Service Management Setup** page determines how orders are created for service contracts with several service items:

- If the **One Service Item Line/Order** is enabled, the batch process creates one service order per service item in the contract. For example, a contract with four service items results in four separate service orders.
- If the **One Service Item Line/Order** is disabled, the batch process creates a single service order containing all service items from the contract.

We'd like to thank our community for making this valuable contribution.

Create purchase orders from drop shipments

> **Important**
>
> **Some of the functionality described in this release plan has not been released.** Delivery timelines may change and projected functionality may not be released (see Microsoft policy). Learn more: What's new and planned

Expand table

Enabled for	Public preview	General availability
Users, automatically	-	Apr 2026

Business value

This feature simplifies the drop shipment process by reducing manual steps and the need to switch between pages. Integrating drop shipment handling into standard planning and the process of creating purchase orders can save you time and improve accuracy on your back orders.

Feature details

You can create purchase orders directly from sales orders that are set up for drop shipment by choosing the **Create Purchase Orders** action.

Drop shipment orders are taken into consideration by the **Order Planning** page, so drop shipment lines are included when calculating plans. Also, the **Planning Worksheet** page now includes a dedicated **Drop Shipment** action group with the **Get Sales Orders** and **Sales Orders** actions, similar to the requisition worksheet.

Create a purchase order from a drop shipment

You can create purchase orders from drop shipments from several pages.

From a sales order:

1. Open a sales order that has lines marked as **Drop Shipment**.
2. Choose the **Create Purchase Orders** action.

3. On the **Create Purchase Orders** page, review the suggested lines. The vendor is added based on information from the **Item Card** or the **Stockkeeping Unit Card** pages. You can change the vendor if needed.

From order planning:

- On the **Order Planning** page, use the **Calculate Plan** action. Drop shipment lines are included.

From a planning worksheet:

- On the **Planning Worksheet** page, use the new **Drop Shipment** action group and the **Get Sales Orders** action to include sales orders.

Create purchase quotes for contacts

> **Important**
>
> **Some of the functionality described in this release plan has not been released.** Delivery timelines may change and projected functionality may not be released (see Microsoft policy). Learn more: What's new and planned

Expand table

Enabled for	Public preview	General availability
Users, automatically	-	Apr 2026

Business value

This feature simplifies the purchasing process by allowing you to work with contacts before you commit to creating vendors. It reduces administrative overhead and speeds up quote registration, while ensuring vendor records are created when needed.

Feature details

You can create purchase quotes for contacts that aren't yet associated with a vendor. This removes the need to set up a vendor record before you prepare a quote, which is useful when you're unsure whether the purchase will proceed.

When you convert the quote into an order or release the document, Business Central automatically creates the vendor using a vendor template. Business Central selects the appropriate template based on criteria such as territory code, country/region code, and contact type from the contact. If only one template matches, it's applied automatically; otherwise, you're prompted to choose from available templates.

Here's an overview of the process:

1. Create a **Purchase Quote**, and select a contact that isn't linked to a vendor.
2. If multiple templates are available, choose a vendor template.
3. Enter the details for the quote.
4. When you release the quote or convert it to an order, Business Central creates the vendor record using the selected template.

Define item attributes for item variants

> **Important**
>
> **Some of the functionality described in this release plan has not been released.** Delivery timelines may change and projected functionality may not be released (see Microsoft policy). Learn more: What's new and planned

Expand table

Enabled for	Public preview	General availability
Users, automatically	-	Apr 2026

Business value

This improvement gives you more accurate and flexible management of product information. It helps you maintain consistent data while still capturing important differences between item variants.

Feature details

Item variants are a great way to keep your list of products under control. For example, you have a large number of items that are almost identical and vary only in color. You can define each variant as a separate item. But you can also choose to set up one item and specify the various colors as variants of the item.

You can assign attribute values that reflect the specific variant at the item variant level. Item variants inherit attributes from the item, and you can adjust or remove those inherited values when the variant requires different information.

You can open the **Item Variant Attribute Values** page from the **Item Variants List** or the **Item Variant Card** pages to review or edit variant-specific attributes. When you add a new variant of an item, the attributes defined for the item transfer to the variant. You can then update or delete the inherited values to ensure the variant shows the correct details.

There is also the new **Update Variant Attributes** action available from the **Item Card** that lets you to force sync attributes from the item to its variants.

Business value

The Quality Management extension for Business Central helps you comply with industry standards and regulatory requirements. Including quality checks in the process of receiving or producing goods improves product reliability and builds customer confidence in your products.

Feature details

Quality Management features are available as an extension. The extension installs automatically on newly deployed environments. For upgraded environments, you can install the extension from AppSource.

The extension gives you full control of when you do quality checks:

- **Purchase Receipts**: Quality checks happen after you post purchase receipts, with or without warehousing handling.
- **Production Output**: Quality checks happen on production output, either manually or automatically (flushing), to verify that the manufactured products meet quality specifications.
- **Assembly Output**: Quality checks happen on assembly output, either manual or automatic (assembly-to-order), to ensure that the assembled items meet quality standards.
- **Manual and Scheduled Checks**: Quality checks trigger manually or at regular intervals on a schedule.

Several parameters are available that let you fine-tune your quality checks:

- **Quality check scope**: Apply the quality check scope to various levels, including individual items, groups, lots, or specific serial and package numbers.
- **Parameters or attributes to assess**: Assess physical measurements such as weight, dimensions, and density to ensure products conform to specifications.
- **Quality check timing and triggers**: Specify the event that initiates the quality control procedure. For example, use an event when you post a purchase receipt, after production or assembly output, or at predefined time intervals.
- **External analysis settings**: Set a fixed quantity or percentage of the total quantity as samples for third-party analysis.
- **Quality test plans**: Define a quality test plan for each scope. Include triggers and a list of testing parameters for each trigger.
- **Quarantine procedures**: Define quarantine procedures to freeze items or prevent their immediate use.

The extension also offers several tools for reporting and analyses.

- **Quality Certificates**: Quality certificates are essential documents that verify the quality and safety of products. They ensure compliance with standards.
- **Certificate of Analysis**: A certificate of analysis provides detailed information about the composition and quality of a product. You often need it for regulatory compliance.
- **Quality Status Overview**: An overview of item quality status helps stakeholders understand the current quality levels and any issues in production.
- **Quality Orders Overview**: An overview of quality orders summarizes customer requirements and production batches. It ensures that quality expectations are met.

Experience improved usability in manufacturing

> **Important**
>
> **Some of the functionality described in this release plan has not been released.** Delivery timelines may change and projected functionality may not be released (see Microsoft policy). Learn more: What's new and planned

Expand table

Enabled for	Public preview	General availability
Users, automatically	-	Apr 2026

Business value

You get more done when processes are easy. We improved the usability in several areas within manufacturing by matching the notification behavior to your daily work. These changes help you record production output more accurately for serial-tracked items, and keep capacity and overhead postings aligned with production locations so that WIP accounts stay balanced and are easier to reconcile. You also get some help to decide how much guidance you want around BOM and routing certification.

Feature details

We've addressed several friction points in manufacturing processes.

Use the Explode Routing action and items with serial numbers

When you report production output for items with serial number tracking, you often need one journal line per serial number. Previously, when you turned on **Item Tracking on Lines** in the **Output Journal** and chose **Explode Routing**, the last operation for a serial-tracked item could still show the full order quantity on the line. With this improvement, Business Central respects item tracking setting when exploding routing lines in output journals:

- For serial-tracked items, Business Central splits the last routing operation into multiple lines with quantity 1 per serial number, and the journal line is ready for you to enter assigned serial number.

- For lot-tracked items, the behavior is unchanged. The operation remains on a single line with the full quantity.

Respect location code when posting capacity and overhead

In many manufacturing environments, you post production consumption and output by location, with separate WIP accounts per site. Until now, capacity and overhead postings were always evaluated against the **Inventory Posting Setup** for a *blank* location code, because the related entries didn't have a location value. This could cause:

- All capacity and overhead costs to be posted to a single WIP account.
- Imbalances when material consumption and output were posted to location-specific WIP accounts, but capacity and overhead went to the blank-location WIP account.
- An error that forced you to maintain an **Inventory Posting Setup** line for blank location when you added overhead to routings and posted the production journal.

With this improvement, Business Central uses the production location when posting capacity and overhead.

The following list describes what we changed.

- Value entries that are linked to capacity ledger entries now have a **Location Code** value that comes from the related production order line or item journal line.
- When you post capacity or overhead, Business Central uses the **Inventory Posting Setup** for that specific location, not the blank location.
- You are no longer forced to keep an **Inventory Posting Setup** line for a blank location just to post overhead.

Control warnings for non-certified production BOMs and routings

When you design or maintain production BOMs and routings, you might work with **non-certified** structures for extended periods. A confirmation message that reminds you that a BOM or routing isn't certified is useful, but it can also become noise if it displays many times per day. Previously, when you tried to close a non-certified production BOM or version, Business Central showed a message such as:

- *The Production BOM has not been certified. Are you sure you want to exit?*

There was no way to turn this specific warning on or off per person. Now, we've added a new **My Notifications** setting so you can control whether to display warnings for non-certified production BOMs and routings. To configure the notification:

1. Choose the **Settings** icon and select **My Settings**.
2. Choose **My Notifications**.
3. Search for "**Warn about non-certified production BOMs and routings**".
4. Turn on the notification if you want to be reminded, or off if you mainly work with non-certified data and don't want the extra confirmation.

Filter receipt and shipment lines to quickly find documents you want to invoice

> **Important**
>
> **Some of the functionality described in this release plan has not been released.** Delivery timelines may change and projected functionality may not be released (see Microsoft policy). Learn more: What's new and planned

Expand table

Enabled for	Public preview	General availability
Users, automatically	-	Apr 2026

Business value

This improvement helps you locate the correct document lines more quickly, especially in environments with a large number of receipts or shipments. By filtering on recognizable business fields such as order number or references from vendors or customers, you reduce time spent searching and lower the risk of bringing in the wrong lines.

Feature details

There are new filters on the **Get Receipt Lines**, **Get Shipment Lines**, and **Get Service Shipment Lines** pages. When you bring receipt or shipment lines into documents such as purchase, sales, or service invoices, you can now narrow the list by filtering on the following fields:

All documents:

- **Order No.**
- **Your Reference**

Sales and service shipments only:

- **External Document No.**

Purchase receipts only:

- **Vendor Order No.**
- **Vendor Shipment No.**

- **Item Reference No.**

These fields come from the related document header and are now stored on the receipt or shipment line, so you can apply filters directly on the lookup pages.

To use the new filters, follow these steps:

1. Open a purchase, sales, or service invoice.
2. Choose the **Get Receipt Lines**, **Get Shipment Lines**, or **Get Service Shipment Lines** action.
3. On the lookup page, use the filters on fields to narrow the list to the specific order or reference you're working with.
4. Select the matching lines and bring them into your document.

Match purchase invoices to multiple order and receipt lines

> **Important**
>
> **Some of the functionality described in this release plan has not been released.** Delivery timelines may change and projected functionality may not be released (see Microsoft policy). Learn more: What's new and planned

Expand table

Enabled for	Public preview	General availability
Users, automatically	-	Apr 2026

Business value

This capability improves purchase invoice accuracy and reduces posting errors by letting you match invoice lines to all relevant PO-lines and receipts. You can work with complex scenarios that involve partial receipts, item tracking, multiple order references, or missing receipts.

Feature details

The purchase order matching experience lets you match purchase invoice lines to multiple purchase order lines and posted receipt lines. You gain much more flexibility compared to the existing **Get Receipt Lines** action, which is based on posted receipts and matches line to line.

The new **Get Order Lines** action on the purchase invoice opens a list of order lines that are received but not invoiced, or order lines that aren't received. You can match each invoice line to any number of purchase order lines, regardless of whether receipts exist. When receipts exist, they display with the relevant details. When receipts don't exist, you can match the invoice line directly to the purchase order lines and decide later whether to receive manually or to use the new auto-receipt capability.

From each invoice line, you can open the **Matched Order Lines** page to review and adjust the order lines that will be invoiced with that invoice line. You can edit quantities, add additional PO-lines or posted receipt lines, and review discrepancies such as price or amount differences. You can also open **Matched Order Lines** on the invoice header to review and correct matching across the entire document.

On purchase orders, the new **Matched Invoice Lines** field shows the quantity matched via invoice lines to each order line.

When you turn on the new **Receipt on Invoice** toggle on the order, posting the linked invoice automatically creates the required receipts. However, you can't enable this option for orders that use advanced warehouse operations, have item tracking, or are already partially received.

This feature has a few limitations:

- It doesn’t work with orders that have prepayments, or lines of the Item Charges type.
- You can’t use it with orders linked to projects, subcontracting, blanket orders, or intercompany transactions.
- You can’t use auto-receive with partially received lines, or locations that use directed put-away and pick (in warehouse management).

Business value

This capability aligns Business Central with workflows where vendor obligations are independent of customer payment timing. It makes drop shipment functionality more practical for businesses that have complex shipping and invoicing requirements.

Feature details

You can post invoices for drop shipment purchase orders, even if you haven't invoiced the related sales order. You can post an invoice from a purchase order or by using the **Get receipt lines** action.

This feature might affect your extensions and customizations. This change modifies the posting logic for drop shipments and removes checks that previously blocked purchase invoice posting until the related sales invoice was posted. The following events are no longer called:

Codeunit 90 "Purch.-Post"

- OnCheckAssocOrderLinesOnBeforeCheckOrderLine
- OnBeforeCheckAssociatedSalesOrderLine

Codeunit 22 "Item Jnl.-Post Line"

- OnBeforeVerifyInvoicedQty
- OnVerifyInvoicedQtyOnAfterGetSalesShipmentHeader

Partners and ISVs should review any customizations or extensions that rely on these events and adjust their logic accordingly.

Reverse drop shipments when sales and purchase documents aren't invoiced

> **Important**
>
> **Some of the functionality described in this release plan has not been released.** Delivery timelines may change and projected functionality may not be released (see Microsoft policy). Learn more: What's new and planned

Expand table

Enabled for	Public preview	General availability
Users, automatically	-	Apr 2026

Business value

This enhancement reduces errors and prevents incorrect customer or vendor data, and improves accuracy in high-volume environments where manual return orders aren't practical. You correct mistakes faster, avoid redundant documents, and maintain clean application history on item ledger entries.

Feature details

You can reverse posted drop shipments when both the sales shipment and the related purchase receipt aren't yet invoiced. Today, when you post a purchase receipt for a drop shipment, Business Central also posts the linked sales shipment and you can't undo the receipt. It's difficult to correct mistakes and often forces you to create credit memos, adjust quantities, or manually recreate sales and purchase lines.

You can now undo a sales shipment that originates from a drop shipment. Business Central reverts the linked purchase receipt, creates correction entries, and reapplies the purchase and sales entries to their reversal entries.

To reverse a drop shipment, open a posted sales shipment connected to it and choose **Undo Shipment**.

Send posted sales shipments and return receipts by email

> **Important**
>
> **Some of the functionality described in this release plan has not been released.** Delivery timelines may change and projected functionality may not be released (see Microsoft policy). Learn more: What's new and planned

Expand table

Enabled for	Public preview	General availability
Users, automatically	-	Apr 2026

Business value

Sales shipments are critical documents for customers, and often need to be delivered promptly and accurately. By sending posted shipments and return receipts by email, you reduce reliance on manual printing and mailing. This streamlined process improves communication with customers, and supports scenarios where you want to share shipment details with different contacts than the ones specified on the invoices.

Feature details

We're introducing the ability to send posted sales shipments and posted return receipts by email, which complements the **Print** option and aligns the experience of handling these documents with that of posted sales invoices and credit memos. This enhancement gives you several options:

- **Send by Email**: Send the posted document by email to the customer.
- **Send**: Use the standard sending options that are available for other posted documents.
- **Attach as PDF**: Generate and add the generated document in PDF format to the **Attachment** part.

The **Attachment** part allows you to store and manage printed document versions for future reference, and is now also available on the following pages:

- **Posted Return Receipt** (page 6660)
- **Posted Return Receipts** (page 6662)

- **Posted Sales Shipment** (page 130)
- **Posted Sales Shipments** (page 142)

Use subcontracting capabilities in production processes

> **Important**
>
> **Some of the functionality described in this release plan has not been released.** Delivery timelines may change and projected functionality may not be released (see Microsoft policy). Learn more: What's new and planned

Expand table

Enabled for	Public preview	General availability
Users by admins, makers, or analysts	-	Jun 2026

Business value

A complex industrial structure can include external vendors that handle specific tasks within the broader production process. Some companies outsource up to 75 percent of their production. Outsourcing can lead to significant cost savings or access to specialized skills and technologies that might not be available otherwise. A typical example is a company that handles research, design, quality control, and sales in-house but outsources all or large parts of the actual production.

Feature details

The standard Dynamics 365 Business Central solution already meets many global needs. We expand that solution to meet local needs by adding capabilities that include:

- Logistics flows that manage subcontractor transfers for raw materials and components, along with warehouse handling and item tracking.
- Flexible pricing that considers the work center, item, dates, and quantity.
- Finished goods receipts with item tracking and warehouse handling from purchase orders.
- Logistics flows that manage subcontractor transfers of finished goods.
- Enhanced usability and more transparency in production processes.

Special note for Italian localizations

The Italian localization currently supports logistics for both finished goods and raw materials/components. We deprecate the existing local functionality and provide upgrade logic to facilitate migration to a new W1 solution. You decide when to start the transition by activating a feature key on the **Feature Management** page.

Sustainability Management

> **Important**
>
> **Some of the functionality described in this release plan has not been released.** Delivery timelines may change and projected functionality may not be released (see Microsoft policy). Learn more: What's new and planned

To align with customer feedback and evolving regulatory demands, we continuously expand key parts of the Sustainability Management capabilities in Business Central.

There are more tools to collect sustainability data:

- Capture environmental data with sustainability journals and purchase documents, either manually or through formulas.
- Monitor emissions, water usage, and waste intensity across companies, countries, regions, or facilities. You can also purchase carbon credits directly within Business Central.
- Import emission factors from external sources through open APIs to ensure accurate and reliable calculations.
- Use Copilot to help estimate your carbon footprint, even when the system doesn't yet have emission factors.

It's easier to track your progress:

- Use the modern Sustainability Role Center to access all sustainability data and key performance indicators (KPIs) in one place.
- Set baselines and targets, and track your progress with scorecards and goal management tools.

You can gain insights faster and simplify reporting:

- Access built-in reports, Excel-based reporting, embedded Power BI dashboards, and analysis views tailored to your sustainability data.
- Use financial reports to compare sustainability entries with statistical or general ledger data.
- Report on various greenhouse gases in CO_2 equivalents, as well as water and waste metrics.
- Customize reports to focus on the sustainability indicators that matter most to your business.
- Meet regulatory requirements by reporting in line with the Corporate Sustainability Reporting Directive (CSRD) and other standards through integration with **External ESG Reporting**.

- Calculate and report data required for Carbon Border Adjustment Mechanism (CBAM) and extended producer responsibility (EPR) compliance.

Enhance your brand reputation:

- Use the integrated sustainability features in Business Central to enable full value chain tracking of Scope 3 emissions across all operations.
- Add carbon footprint data on product invoices or your projects to promote transparency and accountability.

These capabilities provide a comprehensive approach to sustainability management. They help you measure, analyze, and report your environmental impact with confidence and efficiency.

Use new APIs in Sustainability for better integration

> **Important**
>
> **Some of the functionality described in this release plan has not been released.** Delivery timelines may change and projected functionality may not be released (see Microsoft policy). Learn more: What's new and planned

Expand table

Enabled for	Public preview	General availability
Users, automatically	Apr 2026	Jun 2026

Business value

These new APIs make sustainability data easier to integrate with external systems and reporting tools. Businesses can automate ESG reporting, synchronize sustainability goals, and exchange emission details with procurement systems. This reduces manual data handling, improves accuracy, and supports compliance with sustainability regulations and corporate reporting standards.

Feature details

The feature introduces four new APIs in the Sustainability area to improve interoperability and enable automated data flows between Business Central and external applications.

The new APIs are:

- **Goals**: Provides read, insert, and modify operations for sustainability goals.
- **ESG Reporting Staging**: Read-only API for accessing staged ESG reporting data.
- **Emission Value Entry**: Read-only API for retrieving emission value entries calculated in Business Central.
- **Purchase Lines with Sustainability Detail**: Enables read, insert, and modify operations on purchase lines, including sustainability-related fields.

Use new sales document report layouts that show your carbon footprint

> **Important**
>
> **Some of the functionality described in this release plan has not been released.** Delivery timelines may change and projected functionality may not be released (see Microsoft policy). Learn more: What's new and planned

Expand table

Enabled for	Public preview	General availability
Users, automatically	-	Apr 2026

Business value

This feature helps you communicate sustainability information on customer-facing documents. By showing estimated CO_2e per unit and the total emissions on sales invoices and quotes, you can increase transparency, support ESG commitments, and respond to customer demand for carbon footprint data. Including a disclaimer ensures clarity about the source and nature of the estimates.

Feature details

Business Central adds new ESG-focused report layouts for sales documents, enabling you to include carbon-footprint information directly on invoices and quotes. These Word layouts extend existing invoice and quote templates by adding CO_2e information per unit and a total emissions line.

The following documents use the new layouts:

- **Sales Invoice**
  - Standard ESG Sales Invoice (Word)
  - Standard ESG Sales Invoice – Blue (Word)
- **Sales Quote**
  - Standard ESG Sales Quote (Word)
  - Standard ESG Sales Quote – Blue (Word)

Each layout is based on the corresponding standard template and includes additional sustainability fields. These additions allow you to provide transparent emissions information on both quotes (pre-sales) and invoices (post-sales) to ensure consistency between commercial documents and sustainability reporting. The layouts work with existing CO_2e values calculated using value chain operations from the **Sustainability** module and require no additional customization.

Deprecations in Dynamics 365

The release plans are designed to help you plan for the introduction of new features and advanced technologies that evolve our products to meet your critical business requirements. Features may also be gradually discontinued as part of the product lifecycle, so it is important to plan for their deprecation and removal.

A feature or capability that's deprecated is one that we intend to remove in a future release. The feature or capability will continue to work and will be fully supported until it's officially removed. After it's removed, the feature or capability will no longer work. Deprecation notifications can span a few months or years.

We encourage you to use this information, along with the information in the product documentation, to prepare for future releases. This notice is intended to give you sufficient time to plan and update your code before a deprecated feature or capability is removed.

- A deprecated feature is not in active development and may be removed in a future update.
- A removed feature is no longer available in the product.

For current Dynamics 365 deprecations, visit the product documentation below.

- Business Central – Base App
- Business Central – Platform – Clients, Server, and Database
- Commerce
- Dynamics 365 Contact Center
- Customer Insights – Data
- Customer Insights – Journeys

Microsoft Power Platform 2026 release wave 1 plan

The Microsoft Power Platform release plan for the 2026 release wave 1 announces the latest updates to customers as features are prepared for release. You can browse the release plan here online (updated weekly), view it in the Release planner, or download the document as a PDF file, which is updated with every publish. The plan for 2026 release wave 1 covers new features for Power Platform releasing from **April 2026** through **September 2026**.

Download the 2026 release wave 1 PDF for Power Platform or select the option at the bottom of the table of contents.

The Dynamics 365 features coming in the 2026 release wave 1 have been summarized in a separate release plan and a downloadable PDF.

The role-based Copilot offerings features coming in the 2026 release wave 1 have been summarized in a separate release plan as well as a downloadable PDF.

2026 release wave 1 overview

Microsoft Power Platform enables users and organizations to analyze, act on, and automate data to digitally transform their businesses. The 2026 release wave 1 contains hundreds of new features across Power Platform applications, including Power Apps, Power Pages, Power Automate, and Microsoft Copilot Studio, as well as Microsoft Dataverse and Power Platform capabilities for governance and administration.

Power Apps

Power Apps continues to modernize app experiences with a refreshed model-driven UI, improved mobile and offline capabilities, faster search, and expanded AI features. This release brings standardized modern theming to everyone, real-time Dataverse access for offline-first Canvas apps, enhanced search in grids and lookups, and broader availability and extensibility of generative pages to help teams build and scale intelligent apps faster.

Power Pages

Power Pages will further empower pro-developers and low-code makers to build intelligent business portals for your employees, customers, citizens and partners through better integration with market leading AI tools. Additionally, enhanced security agent features will

further support low code makers, pro developers, and admins with actionable insights and abilities for securing their websites.

Power Automate

Power Automate is Microsoft's comprehensive automation platform for cloud flows, desktop flows, and process mining. This release introduces AI agent authoring, optimization, and self-healing capabilities for desktop flows, Copilot Studio-powered actions in cloud flows, enhanced maker and collaboration tools across both, general availability of object-centric process mining, and consolidated governance reporting.

Microsoft Copilot Studio

Microsoft Copilot Studio continues its journey to make agent and agentic workflows even easier to build and more powerful. Now you can further customize agents built with Agent Builder in M365 Copilot, and power your automation with high value AI actions. Deeper governance, multi-agent orchestration and evaluations enable further scaling. With deeper integration with Microsoft Foundry and Work IQ, your agents can use the latest AI technology in coordination with your most organizational data.

Microsoft Dataverse

Microsoft Dataverse continues to invest in enterprise-ready agentic and low-code data platform capabilities. The spotlight is on Work IQ and M365 Copilot integration, delivering organization-specific decisions with adaptive learning and full auditability. We're also enhancing agent programmability with Dataverse APIs, MCP servers, and Python SDK, plus new storage management tools for enterprise-grade compliance at scale.

Governance and administration

Microsoft Power Platform governance and administration introduces admin controls for agent security, real-time risk assessment in Copilot Studio, and AI-powered governance agents that automate tenant monitoring and remediation in this release. Enhanced visibility into usage patterns, granular Copilot credit consumption with PAYG caps, and connector dependencies helps you optimize costs, demonstrate ROI, and maintain compliance. GitHub integration and deploy from Git mature your ALM practices with full audit trails.

Key dates for the 2026 release wave 1

The Dynamics 365 features coming in 2026 release wave 1 have been summarized in a separate release plan and a downloadable PDF.

The Microsoft Power Platform features coming in 2026 release wave 1 have been summarized in a separate release plan and a downloadable PDF.

2026 release wave 1 overview

The 2026 release wave 1 for role-based Copilot offerings brings new innovations that provide you with significant capabilities to transform your business. The release contains new features across Microsoft 365 Copilot for Sales and Microsoft 365 Copilot for Finance.

Microsoft 365 Copilot for Sales becomes the seller's daily command center with richer Sales Chat and Sales Home experiences across desktop and mobile in 2026 release wave 1. Sellers will gain faster access to deal and account insights through configurable record summaries, contextual support in Outlook and Teams, and improved email and meeting intelligence. New governance and extensibility controls will also help organizations scale AI responsibly.

Finance agents in Microsoft 365 will become the daily command center for finance teams, delivering rich, finance data-grounded insights directly in Copilot chat.

Key dates for the 2026 release wave 1

Dynamics 365 2025 release wave 2 plan

The Dynamics 365 and Microsoft release plan for the 2025 release wave 2 announces the latest updates to customers as features are prepared for release. You can browse the release plan online (updated throughout the month), view it in the Release planner, or download the information as a PDF file, which is updated with every publish. The plan for 2025 release wave 2 covers new features for Dynamics 365 releasing from **October 2025** through **March 2026**.

Download the 2025 release wave 2 PDF for Dynamics 365 or select the option at the bottom of the table of contents.

The Microsoft Power Platform features coming in the 2025 release wave 2 have been summarized in a separate release plan as well as a downloadable PDF.

The role-based Copilot offerings coming in 2025 release wave 2 have been summarized in a separate release plan as well as a downloadable PDF.

2025 release wave 2 overview

The 2025 release wave 2 for Dynamics 365 brings new innovations that provide you with significant capabilities to transform your business. The release contains hundreds of new features across Dynamics 365 applications, including Sales, Customer Service, Contact Center, Field Service, Finance, finance and operations cross-app capabilities, Supply Chain Management, Project Operations, Human Resources, Commerce, Business Central, Customer Insights - Data, and Customer Insights - Journeys.

Sales

Dynamics 365 Sales brings the power of AI to help sellers beat their targets and automate busywork in 2025 release wave 2. Copilot delivers actionable insights and autonomous AI agents that work 24x7 to research and engage leads, drive purchase intent, and proactively bring key insights and emergent deal risks—helping sellers close more deals faster. A reimagined interface reorients sellers from data to insights.

Service

Dynamics 365 Customer Service will continue to enhance agentic and Copilot capabilities for Case and Knowledge management, as well as AI-driven routing.

Dynamics 365 Contact Center will continue to focus on enhancing agentic and Copilot capabilities to automate service journeys across digital and voice channels along with

introduction of new omnichannel and supervisor capabilities for 2025 release wave 2.

Dynamics 365 Field Service will deliver AI-powered agents, enhanced scheduling tools, mobile usability improvements, and deeper Microsoft 365 integration in the upcoming release wave. With innovations across inspections, vendor coordination, and Project Operations connectivity, Field Service empowers organizations to deliver smarter, faster, and more seamless service at scale.

Enterprise resource planning

Microsoft Sustainability Manager delivers enhanced capabilities including emissions data allocation, time-based factor mappings, expanded metric modeling, product carbon footprinting, extended data trail, reporting period locking, GRI template updates, and grid emissions tracking—empowering organizations with deeper insights and more accurate, flexible sustainability reporting.

Dynamics 365 Finance is bringing global-scale finance and agentic operations to our customers, enhancing our existing agents, that lead to faster financial close, provide additional automation and optimization across large-scale operations, and continue to enhance our business performance analytics and planning solutions.

Finance and operations cross-app capabilities will enhance Dynamics 365 applications by delivering consistent, scalable platform improvements. Recent updates focus on enabling asynchronous dual-write operations, natural language ERP queries, and intelligent agent development using Model Context Protocol (MCP). These innovations aim to boost productivity, streamline integration, and support data-driven decision-making across business processes.

Dynamics 365 Supply Chain Management will bring enhanced demand planning with event and promotion forecasting, improved quality management for sample handling, and a supplier communication agent for automated vendor interactions in 2025 release wave 2. New supplier engagement tools and warehouse app upgrades will also be introduced to further streamline operations and boost efficiency.

Dynamics 365 Project Operations will continue to deliver powerful enhancements across the project lifecycle. These include improved mobile and browser experiences for time and expense, better project planning with enterprise custom fields, streamlined billing and invoicing workflows, and expanded support for stocked items, investment projects, and migrations to the modern architecture.

Dynamics 365 Commerce advances in-store experience by providing a mobile-first point-of-sale that provides business continuity even during a business outage. The improvements to the Adyen payment connector allow modern payments like Pay by Link across channels, offering

more purchasing options for omnichannel customers. Additionally, omnichannel unified pricing enables retailers to establish more intricate pricing structures, helping them remain competitive.

SMB

Dynamics 365 Business Central introduces intelligent AI agents to enhance efficiency and automation in 2025 release wave 2. These agents seamlessly integrate to execute complex tasks, generate reports, automate processes, and optimize order creation using natural language processing. Additionally, this release focuses on quality management, subcontracting, sustainability, and e-document capabilities.

Customer Insights

Dynamics 365 Customer Insights - Data gives copilots and agents real-time, unified customer profiles, enabling teams to act on insights within their workflow. With enriched data, seamless platform integration, and faster processing, businesses can deliver timely, personalized experiences that boost engagement and conversions.

Dynamics 365 Customer Insights - Journeys empowers businesses to craft personalized, AI-driven customer experiences across all touchpoints. With Copilot, agents, and enhanced orchestration tools, teams can engage the right audiences at scale, streamline lead generation, and accelerate growth.
